MATRIX THEORY-MATGEO PRESENTATION

EE24BTECH11008 - ASLIN GARVASIS

Question

If $A\left(\frac{a}{3},4\right)$ is the midpoint of the line segment joining the points $B\left(-6,5\right)$ and $C\left(-2,3\right)$, then the value of a is

CBSE (10 - 2021)

Solution: Table

Variable	Description
B(-6,5)	coordinates of first point
C(-2,3)	coordinates of second point
Α	midpoint of B and C
k	ratio in which c divides the line joining <i>AB</i>
$\frac{C + kB}{k+1}$	section formula

Table: Variables Used

Theory

$$\mathbf{A} = \frac{k\mathbf{C} + \mathbf{B}}{k+1} \tag{1}$$

Theory

where k is the ratio which **A** divides **B** and **C**, here k=1 (: midpoint)

Theory

$$\implies \mathbf{A} = \frac{\mathbf{B} + \mathbf{C}}{2} \tag{2}$$

$$\implies \mathbf{A} = \frac{\binom{-6}{5} + \binom{-2}{3}}{2} = \frac{\binom{-8}{8}}{2} = \binom{-4}{4} \tag{3}$$

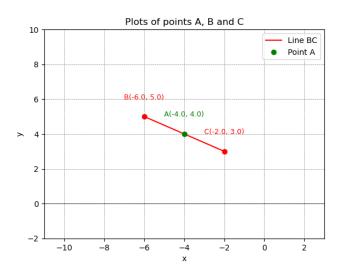

$$\therefore \mathbf{A} = \begin{pmatrix} \frac{a}{3} \\ 4 \end{pmatrix} \tag{4}$$

$$\implies a = -4 \times 3 \tag{5}$$

$$\implies a = -12 \tag{6}$$

Simulation

C-code

```
#include <stdio.h>
int main() {
    FILE *file = fopen("points.txt", "w");
    if (file == NULL) {
        printf("Error opening file!\n");
        return 1;
    }
    // Define the points
    int x1 = -6, y1 = 5;
    int x2 = -2, y2 = 3;
```

C-code

```
fprintf(file, "Point 1: (%d, %d)\n", x1, y1);
fprintf(file, "Point 2: (%d, %d)\n", x2, y2);

// Close the file
fclose(file);

return 0;
}
```

Output in points.txt

```
Point 1: (-6,5)
Point 2: (-2,3)
```

```
import sys
#for path to external scripts
sys.path.insert(0, '/home/matgeo/codes/CoordGeo')
#path to my scripts
import numpy as np
import numpy.linalg as LA
import matplotlib.pyplot as plt
import matplotlib.image as mpimg
#local imports
from line.funcs import *
```

```
# Read the points from the file
with open('points.txt', 'r') as file:
    lines = file.readlines()
# Extract the coordinates
point1_str = lines[0].strip().split(': ')[1]
# Get the string after 'Point 1 : '
point2_str = lines[1].strip().split(': ')[1]
# Get the string after 'Point 2 : '
# Convert the string coordinates to tuples
# Use eval to convert string to tuple
x1, y1 = eval(point1_str)
x2, y2 = eval(point2_str)
```

```
B=np.array([x1,y1]).reshape(-1,1)
C=np.array([x2,y2]).reshape(-1,1)
A=np.array([(x1+x2)/2,(y1+y2)/2]).reshape(-1,1)
# generation of line
x_BC = line_gen(B,C)
# plotting line
plt.plot(x_BC[0,:],x_BC[1,:],label='$BC$')
#Labeling the coordinates
